

SELLER DUE DILIGENCE & RISK REVIEW REPORT

BY STOP OIL SCAM TEAM

Seller Due Diligence & Risk Review | Ref: SOS-DD-2026-003 | 27/02/2026

Prepared by : STOP OIL SCAM TEAM

Review Type: Independent Seller Due Diligence & Risk Assessment

Date of Review: 27/02/2026

Seller Risk Level: ● HIGH RISK

Report Reference ID: SOS-DD-2026-003

1. Executive Summary

Transaction Overview :

The proposed transaction involves the storage of **200,000 MT** of **EN590 (10ppm Diesel)** under a **Tank Storage Agreement** (TSA) reportedly executed in **(XXXXXXX)** between:

- Seller: **(XXXXXXX)**
- Buyer: **(XXXXXXX)**

The agreement claims:

Parameter	Declared Value
Storage Volume	200,000 MT
Storage Duration	5 Days
Contract Term	365 Days
Daily Storage Rate	\$58,000

CONTACT: STOPOILSCAMS@GMAIL.COM

Confidential – For intended recipient only. Redistribution without consent is prohibited.

Supporting documents reviewed:

- Tank Storage Agreement (**TSA**)
- **Contract** excerpts
- **Website and domain** footprint of the seller
- **Public port** and terminal registry data

Transaction Overview :

Our investigation identified **multiple high-risk** anomalies consistent with known oil-storage fraud patterns.

Major concerns include:

- The seller domain (XXXXXXX) was registered (XXXXXXX) through a **Russian registrar (RU-CENTER)** and hosted on a Russian IP server, which contradicts its claim of being a **Dutch logistics company**.
- The company website contains **generic repetitive** content, often associated with **template or AI-generated scam** websites.
- The TSA contract includes critical **formatting errors**, including a **misspelling of Rotterdam ("ROTTERAM")**.
- **No actual** terminal **operator, tank numbers, or facility name** are provided in the contract.

CONTACT: STOPOILSCAMS@GMAIL.COM

Confidential – For intended recipient only. Redistribution without consent is prohibited.

- **No independent** proof of product storage exists such as:
 - Tank Storage Receipt (**TSR**)
 - **Pipeline** Injection Report
 - **Port Authority** confirmation
 - **SGS inspection** documentation
- Claimed storage capacity **240,000 m³ is not verifiable** through any official **Rotterdam terminal** registry.

Overall Risk Assessment : Risk Level: HIGH RISK

The cumulative **evidence strongly** suggests that this storage transaction is **not legitimate**.

The structure, **documentation** style, and missing **verifications** match known international oil storage **scam** patterns.

Recommendation:

Extreme caution is **advised**. Do not proceed with **any financial** commitment until independent **terminal** verification is obtained.

2. Identity Overview

Seller Company Name: (XXXXXXX)

Country of Registration: (XXXXXXX)

Registered Address: (XXXXXXX)

Company Registration Number: (XXXXXXX)

Date of Incorporation: 2007

Initial Observations:

The company presents itself as a **shipping and logistics** provider, with website claims including **maritime logistics**, cargo transportation, and **petroleum product trading**.

No independent evidence was found confirming that the company holds oil storage terminal licenses, refinery supply mandates, or **regulated petroleum trading authorization**.

While the company appears **registered** in the Netherlands, its **online presence** and operational footprint are limited compared to the scale of oil storage and **trading activities** claimed, which warrants further verification.

CONTACT: STOPOILSCAMS@GMAIL.COM

Confidential – For intended recipient only. Redistribution without consent is prohibited.

3. Corporate & Legal Verification

Corporate registry **checks** indicate that (XXXXXXX) appears as a registered entity in the **Dutch** Chamber of Commerce, suggesting **legal company existence**.

However, the investigation identified several concerns:

- Business classification **appears** related primarily to **logistics** and transport services, **not petroleum** storage operations.
- **No verified records** link the company to **licensed** oil terminal operations in Rotterdam.
- **No refinery** partnerships, tank ownership, or **pipeline allocation** records were identified.
- The registered address appears to be a **commercial office location** rather than an **industrial energy facility**.

These factors indicate that while the **company** may exist as a legal entity, its capacity to operate **large-scale oil storage** or trading activities remains **unverified**.

4. Transaction & Storage Overview

The TSA claims **storage of 200,000 MT** EN590 Diesel at a **Rotterdam** terminal.

Volume Conversion Analysis:

Metric	Value
Diesel Density	~0.83 t/m ³
Volume Equivalent	~240,000 m ³

This would require **large-scale** industrial tank infrastructure.

No independent proof of product storage exists such as:

- **No terminal** name is specified
- **No tank identification** numbers are provided
- **No terminal** operator confirmation exists

Legitimate Rotterdam terminals normally provide clear facility **identification** details, including **tank** numbers, the terminal **operator's** name, port **permit** references, and the exact **storage** block location.

Well-known operators in the **port include** companies such as **Royal Vopak**, Odfjell Terminals, **Koole Terminals**, and Oiltanking. However, **no verifiable** connection to any of these **operators could** be confirmed.

5. Tank Storage Agreement (TSA) Forensic Review

Detailed examination of the **TSA revealed** several inconsistencies.

Document Irregularities

- Typographical **Error: "ROTTERAM"** is written instead of Rotterdam.
- Inconsistent Dates: TSA reference shows **(XXXXXXX)** while the execution **date is (XXXXXXX)**.
- **Missing Terminal Name:** Only a generic term **"Rotterdam Seaport"** is mentioned without specifying the terminal.
- **Tank IDs Missing:** Tank numbers are **not listed** and are said to be provided later through the TSR.
- Boilerplate Clauses: The document includes multiple **unrelated global locations** such as Houston, Fujairah, and Singapore.

Legitimate **Rotterdam terminals** normally provide clear facility identification details, including tank numbers, the **terminal** operator's name, port permit references, and the **exact storage block** location.

Legitimate tank agreements normally include precise details such as exact tank **numbers**, terminal operator information, **port authority** references, and defined injection procedures, but none of these **elements are present** in the document.

CONTACT: STOPOILSCAMS@GMAIL.COM

Confidential – For intended recipient only. Redistribution without consent is prohibited.

6. Terminal Operator Verification

However, corporate legitimacy does **not automatically confirm** trading capability in the international **petroleum market**.

The contract simply references:

“Rotterdam Commercial Seaport Terminal”

This entity does not exist in the **official Rotterdam** terminal registry.

Investigation of the Port of Rotterdam operator listings confirmed:

- **No terminal** operated by MPC Shipping & Logistics BV
- **No storage license** associated with the seller
- **No registered tank** park under that name

The seller website claims a **240,000 m³** terminal, however **no** evidence supports this claim.

CONTACT: STOPOILSCAMS@GMAIL.COM

Confidential – For intended recipient only. Redistribution without consent is prohibited.

7. Port Authority Registration Check

Legitimate storage operators in the **Port of Rotterdam** must comply with strict **regulatory and registration** requirements before handling petroleum products.

Companies operating in the port must be **registered** with the Chamber of Commerce (**KVK**) to confirm their **legal business** status in the Netherlands.

Environmental **permits** are required to ensure **safe storage** and handling of petroleum products under **regulatory standards**.

Operators must additionally **obtain tank farm** operating certification confirming the **facility meets** safety and technical requirements.

Due to these **missing elements**, the entire supply **chain remains** unverified, creating significant **transaction risk**.

No verified registration, license, or certification records were found for MPC Shipping & Logistics BV in **relation to Rotterdam** storage operations.

The **absence** of these required authorizations strongly suggests the seller does **not control** any legitimate storage facility.

8. Storage Capacity Validation

The seller claims a total **storage capacity** of 240,000 m³.

This capacity figure closely corresponds with the **200,000 MT** contract volume mentioned in the agreement.

The alignment suggests the storage number may have been structured to match the **deal size** rather than reflect **actual tank capacity**.

In legitimate storage arrangements, sellers normally provide a **detailed tank capacity** breakdown for verification.

Such documentation typically includes **individual tank** identification numbers assigned by **the terminal**.

Verified transactions also include **storage allocation** records confirming where the **product is stored**.

However, **no such supporting information** or documentation was provided in this case.

9. Allocation & Injection Verification

No evidence of physical product **allocation was provided** in the documentation.

Several critical verification **documents are missing**, including the Allocation Letter (AL) that normally confirms the **product has been officially** assigned to the buyer.

The Pipeline Injection Receipt (**PIR**), which records the movement of product from the refinery into the **pipeline or terminal system**, was also not provided.

There is **no terminal** intake confirmation to verify that the product was physically received and entered into **storage** at the terminal facility.

In addition, a refinery **release notice**, which normally confirms that the refinery has dispatched the **product for delivery**, is absent from the documentation.

Without **pipeline injection** or movement records, there is no operational evidence that the **product has actually** entered the supply chain.

In the petroleum trading industry, a common verification principle applies: **“No pipeline movement = No product.”**

10. TSR / ATV / POP Verification

No valid Proof of Product (POP) documentation was **provided** in the transaction records.

One of the most critical **missing documents** is the Tank Storage Receipt (TSR), which normally **confirms that the product** is physically stored in a specific tank at a terminal facility.

The Authority to Verify (**ATV**) was also not provided, which would normally allow the **buyer or their representatives** to verify the product directly with the **storage terminal**.

In addition, **Dip Test Authorization** is missing, which would normally permit an **independent inspection** company to physically measure the product inside **the storage tank**.

Another important document that is **absent** is the **SGS inspection** report, typically issued by an **independent inspection** company to confirm the product's quantity and quality.

These documents are **considered standard** verification requirements in legitimate storage and **petroleum** trading transactions.

Their **absence creates** a significant **gap in verification** and substantially increases the overall transaction risk.

11. Signature & Seal Analysis

The TSA document includes only **typed names** instead of **authentic signatures**, which raises concerns about the **document's legal** execution.

The declared signatories listed in the **agreement** are (XXXXXXX) for (XXXXXXX) and (XXXXXXX)for (XXXXXXX).

In legitimate **commercial contracts**, agreements are normally executed with verified handwritten or digitally authenticated signatures.

However, the document does **not contain any handwritten** signatures from either party.

There is also **no digital authentication** or secure electronic signature verification included in **the agreement**.

Additionally, the document **lacks a corporate seal** or official company stamp, which is often used in **formal international** trade agreements.

The absence of **signature verification** and legal certification suggests that the contract may have been **digitally assembled** rather than formally executed.

12. Logistics & Movement Capability

A legitimate storage and fuel trading operation **requires a clearly** defined physical supply chain.

This supply chain normally follows a standard sequence: **Production → Pipeline → Terminal → Tank → Vessel → Buyer.**

Each stage in this process is usually **supported by logistics** documentation confirming the movement of the product.

In this case, **no evidence** of actual logistics **movement was identified** in the documentation provided.

There is **no vessel nomination**, which would normally indicate the ship assigned to lift the product from the terminal.

Additionally, **no pipeline** slot booking or port berth **reservation records** were presented.

There is also **no AIS vessel tracking** or maritime movement data, suggesting the claimed **fuel movement** may be purely theoretical rather than operational.

13. Procedure Risk Analysis

The procedure resembles known **CI-DIP scam** structures.

These typically involve:

- **Signing** contract
- **Buyer pays** activation fee
- Seller promises **TSR or dip test later**

Legitimate deals require **SGS verification** before payment.

The procedure described in this **deal does not meet industry** trading standards.

14. Terminal Name Misuse

The contract references a **generic terminal** identity rather than a specific operator.

Fraud investigations frequently identify this tactic where scammers:

- invent **terminals**
- **copy refinery** images
- create **fake tank agreements**

The Rotterdam port contains many **legitimate terminals**, yet none match the one described.

CONTACT: STOPOILSCAMS@GMAIL.COM

Confidential – For intended recipient only. Redistribution without consent is prohibited.

15. Seller Authority to Use Storage

No document proves the **seller has legal** control over the claimed tanks.

Missing authorization documents:

- Terminal **lease agreement**
- **Tank allocation** certificate
- **Storage** mandate

Legitimate deals require **SGS verification** before payment.

Tank allocation certificate

16. Financial Transaction Realism

The deal scale is extremely **large relative** to the seller profile.

Estimated Transaction Value

- Commodity value estimated at **\$120M+**
- Storage fee estimated at **\$290,000**
- Represents a **high-value transaction** requiring strict verification.

The company profile does **not demonstrate** capacity to manage such a transaction. This mismatch is common in **fraudulent commodity** offers.

CONTACT: STOPOILSCAMS@GMAIL.COM

Confidential – For intended recipient only. Redistribution without consent is prohibited.

17. Commission & Broker Risk

No **formal brokerage** structure was provided.

Missing documents:

- **IMFPA** agreement
- **NCNDA** agreement
- Commission **distribution** schedule

Lack of broker **transparency increases** the probability of hidden commission traps.

18. Banking & Payment Structure

No **verified banking** details were provided.

Legitimate storage operators **accept payment** only through corporate **bank accounts matching** the registered entity.

Fraud cases often redirect payments to:

- **personal** accounts
- **offshore** intermediaries
- **unrelated** companies

Bank verification would be required before any transaction.

19. Supply Chain Mapping

A legitimate **petroleum transaction** normally follows a documented chain: **Production → Pipeline → Terminal → Tank → Vessel → Buyer**. Each stage is typically supported by **verifiable logistics** and documentation.

In this case, **no refinery or production** source is identified, leaving the origin of the **product unverified**.

There is also **no pipeline or transportation** route provided, which would normally confirm how the product moved to the **storage terminal**.

Additionally, **no storage intake** or **injection record** is available, such as terminal entry logs or tank **allocation details**.

Due to these **missing elements**, the entire supply chain remains **unverified**, creating significant transaction risk.

No refinery source, **pipeline route**, **storage** intake record, or tank allocation/injection documentation has been identified.

As a result, the entire **supply chain** remains unverified, creating significant transaction risk.

20. Storage Scam Pattern Comparison

Scam Pattern	Evidence	Risk Level
Fake TSA	Contract formatting errors	High
Fake TSR	No authentic TSR provided	High
Fake Terminal	Terminal identity unverified	High
Fake Injection	No pipeline record	High
Fake Allocation	No refinery allocation	High
Template POP	Generic documentation	High
No Port License	Seller not registered operator	High
No Operator Link	No connection to terminal	High
CI-DIP Structure	Payment before verification	High

21. Forensic Risk Scoring Matrix

Investigation Area	Risk Score
TSA Authenticity	9
Terminal Verification	10
Storage Capacity	8
Allocation Proof	9
Logistics Feasibility	8
Seller Authorization	9
Procedure Structure	8
Financial Strength	8

Average Risk Score: 8.4 / 10

Overall classification: High Risk

22. Critical Red Flags

Major red flags include:

- **Suspicious domain** registration and hosting location
- **Generic website** content and exaggerated claims
- **Missing terminal** identification
- **No TSR or pipeline** documentation
- **No port authority** verification
- **No supply** chain confirmation
- Non-**verifiable** signatures

23. Final Risk Rating

 **HIGH RISK**

Based on the **forensic review**, the probability of this transaction being legitimate is **extremely low**.

The documentation provided **fails multiple critical** verification checks required in **international petroleum trading**.

CONTACT: STOPOILSCAMS@GMAIL.COM

Confidential – For intended recipient only. Redistribution without consent is prohibited.

24. Investigator Recommendation

DO NOT PROCEED WITH THIS TRANSACTION at this stage due to **multiple verification gaps and missing** documentation.

Before any further engagement is **considered**, the seller must provide several critical documents to **establish the legitimacy** of the transaction.

This includes **official terminal confirmation** from the storage operator and an authentic **Tank Storage Receipt (TSR)** issued directly **by the port terminal**.

The seller must also provide a **pipeline injection report** confirming that the product has physically entered the **storage or terminal system**.

In addition, an **SGS quality** and quantity inspection report should be presented to verify the existence and **specifications of the product**.

Finally, verified banking documentation **should be provided** to confirm the financial credibility and legitimacy **of the seller**.

Until these verifications are **independently confirmed**, any financial commitment or exposure should be **strictly avoided**.
